

I am urging the FCC to reject the NAB's attempts to limit programming on satellite radio. The ostensible argument is that satellite radio is not to produce "local programming". I am one user who uses the weather (sometimes traffic, also) for cities other than the one in which I live for travel planning purposes.

Beyond this, this is a paid service which I should have a right to.

Fighting advances in the technology of communications (and limiting access to data which a citizen should have the right to have) is analagous to the kinds of repressive control of media which we are trying to combat in Middle Eastern religious oligarchies--let's let more information out, not less, and let's keep our systems growing.
